

AmaduTown Advisory Solutions, LLC

STAFF FIELD GUIDE · START HERE

A place to learn. A clear way to help.

Portfolio is our shared business workspace. We use it to organize client work, review AI-assisted drafts, and track what happened.

Start by reading, checking, and asking questions. Your supervisor will guide your first assignment.

Your first responsibility: check before acting.

This guide grants no account access or approval authority. Use practice examples until your supervisor assigns real work.

01 How the business fits together

From a website to a shared workspace

Portfolio grew around the work the business needed to do. Read this as a map of capabilities, rather than a dated company history.

Stage 1

Show the work

A website introduces services, projects, and resources.

Stage 2

Organize delivery

Intake, proposals, client work, and payments connect around a request.

Stage 3

Coordinate assistance

Agents and workflows prepare work; people review decisions and inspect receipts.

Stage 4

Carry learning forward

Open Brain keeps reviewed knowledge with its sources for future work.

Today's working loop

People and requests → Portfolio → assigned agents or n8n workflows → human review → authorized execution → receipt back in Portfolio.

Supabase holds operational records. Approved learning can move into Open Brain. Communication and payment tools carry out their own bounded parts of the work.

02 A day in the life

Follow one request through six steps

A practice example: helping a fictional client organize follow-up. Read each step with your supervisor before trying a real request.

1 Intake

A fictional client asks for help organizing follow-up. Record the need, source, and owner in the assigned workspace.

2 Agent work

An assigned assistant prepares a summary and proposed next step. Treat its output as a draft.

3 Review

Check the source, facts, recipient, and wording. Return unclear work for revision.

4 Approval

The authorized reviewer approves the exact action and version. Approval to prepare a draft does not authorize a send.

5 Execution

An authorized person or enabled workflow performs only the approved action after its checks pass.

6 Receipt / audit

Check the recorded outcome. A request or approval alone does not prove delivery. Escalate an uncertain result before retrying.

If a step is blocked, keep the work there and ask its owner. A missing receipt is a reason to investigate before retrying.

03 Where people make the decisions

Approvals, privacy, and safe practice

Safe ways to begin

- Read assigned material and compare a draft with its source.
- Practice with synthetic examples and record clear review notes.
- Ask who owns the next decision and what evidence they need.

Separate permission is required

- Creating a Gmail draft, sending email or SMS, posting a public reply, publishing, and scheduling.
- Activating a provider, changing credentials, billing, access permissions, or production data.
- Moving private material into another tool, public content, or durable memory.

What never follows automatically from a draft

An AI recommendation, a “ready” label, a test result, or a general “proceed” does not grant send authority. Approval must match the action and its scope. An approved workflow may later execute automatically within those limits.

When work is marked “no egress”

Keep that task’s information and actions inside its stated boundary. Do not send messages, upload client material, or call an outside provider from that task. Ask the owner before changing its scope.

Keep passwords, tokens, private chats, and raw client details out of review notes and screenshots. Use the approved access process and share only the minimum information needed.

04 Your first week

A checklist for your assigned role

Begin with Support and coordination unless your supervisor assigns another role. These checklists describe practice, not new permissions. Marks reset when you leave or reload this page.

Support and coordination

- ☐ Day 1: Confirm your supervisor, assigned workspace, and approved sign-in method. Read this guide.
- ☐ Day 2: With your supervisor, trace one practice request from its source to its recorded outcome.
- ☐ Day 3: Review a synthetic draft for names, facts, tone, and missing information.
- ☐ Day 4: Practice returning a draft with a clear correction. Observe an authorized approval.
- ☐ Day 5: Explain the difference between prepared, approved, and completed. Agree on your next supervised task.

Reviewer

- ☐ Day 1: Confirm which decisions you may approve and which belong to Vambah or another owner.
- ☐ Day 2: Compare a practice draft with its source; identify unsupported claims.
- ☐ Day 3: Check the exact recipient, channel, message version, and scope before a practice approval.
- ☐ Day 4: Walk through a blocked action and its recovery with the owner; avoid bypassing the gate.
- ☐ Day 5: Inspect an outcome receipt and explain what it proves, what it does not, and when to escalate.

Technical operator

- ☐ Day 1: Confirm access scope, environment, and the current runbook with the technical owner.
- ☐ Day 2: Trace a synthetic request through Portfolio, its workflow, and its audit record.
- ☐ Day 3: Verify a blocked provider path without enabling it or using real client data.
- ☐ Day 4: Prepare a scoped change with tests and a reviewable pull request.
- ☐ Day 5: Review rollback and deployment evidence with the Integration Captain; keep activation authority separate.

Ready for real work? Have your supervisor confirm your scope, access, and escalation contact before the first assignment.

05 The tools behind the work

What each tool does and how it connects

Each tool has a job. You do not need to learn every tool to help with the work.

Repo evidence reviewed October 1, 2026. This is a capability map, not a live service-status report. Account access, provider activation, and availability must be confirmed by the owner.

Core runtime

Portfolio · Next.js / React

The browser workspace where staff see requests, drafts, decisions, and results. Next.js and React build its pages and actions.

Automation

n8n

Runs configured sequences of tasks behind a workflow. Portfolio can hand work to n8n and receive results. A workflow must be enabled and authorized for its specific action.

Data and memory

Supabase / Postgres

Supabase connects sign-in, database records, and file storage. Postgres is the database underneath. Permissions determine what each account can access.

Open Brain

The local-first memory core: sources become proposals, then approved memories. Portfolio shows a projection; compiled wiki pages are summaries of approved records.

Communication

Slack

Brings work notifications and review requests to the team. A receipt confirms what was recorded; it does not by itself prove an email or message was sent.

Gmail / Google Workspace

Supports business email and shared working materials. Portfolio has email review and draft workflows; draft creation and sending have separate permission gates.

Telnyx

The SMS provider supported by the outreach code. Sending requires provider readiness, an enabled execution gate, and approval for the exact recipient and message.

AI assistance

OpenAI / model providers

Help draft, summarize, and classify information through configured AI workflows. Models can be wrong. Use approved inputs and verify output before acting.

Access and payments

1Password

Holds approved credentials for people and services. Request access through your supervisor; never copy a password or API key into a task or chat.

Infisical

The documented secret-management system for runtime/API credentials. Technical owners manage scoped access; staff should use the approved access process.

Stripe

Handles supported checkout and payment events. Portfolio records related order or proposal status. A prepared proposal is not evidence of payment.

Build and deployment

GitHub / Codex

GitHub keeps code history and proposed changes. Codex assists with implementation and review work. A pull request is a proposal until reviewed and merged.

Vercel

Builds and hosts the site. Preview, staging, and production are different environments; a successful preview does not prove a production release.

Observability

Run history, audit records, deployment metrics

Show what ran, what was approved, and where an error occurred. Vercel Speed Insights measures page performance; workflow and provider receipts answer different questions.

Optional / experimental

Jev shadow benchmark

An offline, synthetic comparison harness exists in the repo. It uses a mock adapter; live model quality and production readiness are unproven. It grants no permission to send or activate a provider.

Cannot sign in or see a workspace?

Confirm you opened the link your supervisor provided and used the assigned account. Ask your supervisor to confirm your role and invitation. Never request someone else's password.

An action is blocked or a result is missing?

Read the reason shown. Note the page, time, safe item ID, expected result, and exact error without private data. Send those details through your approved internal support channel to the work owner or Vambah. If a send or payment may have happened, wait for the owner to check its receipt before retrying.

Something looks private or unsafe?

Stop the action. Avoid copying or forwarding the material. Ask Vambah or the assigned supervisor to review the access or privacy concern.

Need a printable copy?

Open Print / Save as PDF at the top of this guide, then choose your browser's PDF destination. Save locally; review the file before sharing it.

Words you will see**Agent**

Software assigned a bounded task, such as preparing a draft. It is not the decision owner.

Approval gate

A checkpoint that requires the right person and evidence before proceeding.

Receipt / audit trail

A record of an action and its outcome. Check whether it records a request, acceptance, or actual completion.

API / webhook

A structured way for tools to request work or report an event to another tool.

Preview / staging / production

A change under review, a testing environment, and the live environment used for real work.

Workflow

A defined sequence of steps, sometimes automated.

No egress

A bounded task is kept from sending data or actions to outside systems. This is a task-specific restriction, not a claim that the whole company runs offline.

Source of truth

The authoritative record. A dashboard or summary may only show a copy.

Credential

A password, token, or key that grants access. Keep it in the approved password manager.

Shadow / mock

A comparison that does not control real actions / a simulated provider used for testing.
